Day 4

Setting the Data Type

In Python, the data type is set when you assign a value to a variable:

Example	Data Type
x = "Hello World"	str
x = 20	int
x = 20.5	float
x = 1j	complex
x = ["apple", "banana", "cherry"]	list
x = ("apple", "banana", "cherry")	tuple
x = range(6)	range
x = {"name" : "John", "age" : 36}	dict
x = {"apple", "banana", "cherry"}	set
x = frozenset({"apple", "banana", "cherry"})	frozenset
x = True	bool
x = b"Hello"	bytes
x = bytearray(5)	bytearray
x = memoryview(bytes(5))	memoryview
x = None	NoneType

Git:

1. Always stay in sync with your GitHub repo if working in group setting or working alone on different machines.
    1. Git pull origin main
2. Cloning a repository:
    1. Git clone URL_OF_REPO
3. Revert the changes in the WHOLE FILE! (Use it with Caution!!!)
    1. Git revert FILE_NAME
